

6.1 The Greatest Common Factor & Factoring by Grouping DAY ONE

REVIEW

a factored form of 6

$$\begin{array}{c} \overbrace{2 \cdot 3} \\ \uparrow \quad \uparrow \\ \text{factor} \quad \text{factor} \end{array} = \overbrace{6}^{\text{product}}$$

a factored form of x^5

$$\begin{array}{c} \overbrace{x^2 \cdot x^3} \\ \uparrow \quad \uparrow \\ \text{factor} \quad \text{factor} \end{array} = \overbrace{x^5}^{\text{product}}$$

a factored form of $x^2 + 5x + 6$

$$\begin{array}{c} \overbrace{(x+2)(x+3)} \\ \uparrow \quad \uparrow \\ \text{factor} \quad \text{factor} \end{array} = \overbrace{x^2 + 5x + 6}^{\text{product}}$$

$$\text{Product } (2)(3) = 6$$

2 & 3 are factors of 6

$(2)(3)$ is in factored form of 6

The process of writing a polynomial as a product is called **factoring the polynomial**.

✓ CONCEPT CHECK

Multiply: $2(x - 4)$

What do you think the result of factoring $2x - 8$ would be? Why?

$$2x - 8$$

$$(2)(x - 4)$$

OBJECTIVE 1: Finding the Greatest Factor of a List of Integers

The first step in factoring a polynomial is to see whether the terms of the polynomial have a common factor (GCF).

If there is one then write the polynomial as a product by factoring out the common factor.

This term factored out is called the greatest common factor or GCF.

Finding the GCF of a List of Integers

Step 1. Write each number as a product of prime numbers.

Step 2. Identify the common prime factors.

Step 3. The product of all common prime factors found in Step 2 is the greatest common factor. If there are no common prime factors, the greatest common factor is 1.

Example 1: Find the GCF of each list of numbers.

a) 28 and 40

$$\begin{array}{l} \textcircled{4} \overset{\wedge}{7} \\ 2 \overset{\wedge}{2} \\ 2 \cdot 2 \cdot 7 \\ 2^2 \cdot 7 \end{array} \quad \begin{array}{l} \textcircled{4} \overset{\wedge}{10} \overset{\wedge}{2} \overset{\wedge}{5} \\ 2 \overset{\wedge}{2} \overset{\wedge}{2} \overset{\wedge}{5} \\ 2 \cdot 2 \cdot 2 \cdot 5 \\ 2^3 \cdot 5 \end{array}$$

$$2^2 = \boxed{4}$$

b) 55 and 21

$$\begin{array}{l} 5 \overset{\wedge}{11} \\ 5 \cdot 11 \end{array} \quad \begin{array}{l} 3 \overset{\wedge}{7} \\ 3 \cdot 7 \end{array}$$

$$\boxed{1}$$

c) 15, 18, and 66

$$\textcircled{3} \cdot 5 \quad \underline{3} \overset{\wedge}{3} \cdot 2 \quad 2 \textcircled{3} \cdot 11$$

$$\boxed{3}$$

Practice 1:

a) 36 and 42

$$\begin{array}{l} 4 \overset{\wedge}{9} \\ 2 \overset{\wedge}{2} \overset{\wedge}{3} \overset{\wedge}{3} \\ 2^2 \cdot 3^2 \end{array} \quad \begin{array}{l} 6 \overset{\wedge}{7} \\ 2 \overset{\wedge}{3} \\ 2 \cdot 3 \cdot 7 \end{array}$$

$$2 \cdot 3 = \boxed{6}$$

b) 35 and 44

$$\begin{array}{l} 5 \overset{\wedge}{7} \\ 5 \cdot 7 \end{array} \quad \begin{array}{l} 4 \overset{\wedge}{11} \\ 2^2 \cdot 11 \end{array}$$

$$\boxed{1}$$

c) 12, 16, and 40

$$\begin{array}{l} 4 \overset{\wedge}{3} \\ 2^2 \cdot 3 \end{array} \quad \begin{array}{l} 4 \overset{\wedge}{4} \\ 2^4 \end{array} \quad \begin{array}{l} 4 \overset{\wedge}{10} \\ 2^3 \cdot 5 \end{array}$$

$$2^2 = \boxed{4}$$

OBJECTIVE 2: Finding the Greatest Common Factor of a List of Terms

The greatest common factor of a list of variables raised to powers is found in a similar way.

$$\begin{array}{l}
 4 \\
 2^2 \\
 27 \\
 3^3
 \end{array}
 \quad
 \begin{array}{l}
 x^2 = x \cdot x \\
 x^3 = x \cdot x \cdot x \\
 x^5 = x \cdot x \cdot x \cdot x \cdot x
 \end{array}$$

Example 2: Find the GCF of each list of terms.

a) x^3 , x^7 , and x^5

b) y , y^4 , and y^7

$$x^3$$

$$y$$

Practice 2:

a) y^6 , y^4 , and y^7

b) x , x^4 , and x^2

$$y^4$$

$$x$$

Helpful Hint

Remember that the GCF of a list of terms contains the smallest exponent on each common variable.

The GCF of x^5y^6 , x^2y^7 , and x^3y^4 is x^2y^4 .

Smallest exponent on x

Smallest exponent on y

Example 3: Find the GCF of each list of terms.

a) $6x^2$, $10x^3$, & $-8x$
 $2 \cdot 3 \cdot x \cdot x$ $2 \cdot 5 \cdot x \cdot x \cdot x$ $-1 \cdot 2^3 \cdot x$

$$\boxed{2x}$$

b) $18y^2$, $-63y^3$, & $27y^4$
 $3^2 \cdot 2 \cdot y \cdot y$ $-1 \cdot 7 \cdot 3^2 \cdot y \cdot y \cdot y$ $3^3 \cdot y \cdot y \cdot y \cdot y$

$$3^2 y^2 \quad \boxed{9y^2}$$

c) a^3b^2 , a^5b^1 , & a^6b^2

$$\boxed{a^3b}$$

Practice 3: Find the GCF of each list of terms.

a) $5y^4$, $15y^2$, & $-20y^3$

$$5 \cdot y \cdot y \cdot y \cdot y$$

$$\boxed{5y^2}$$

b) $4x^2$, x^3 , & $3x^8$

$$2^2 \cdot x \cdot x$$

$$\boxed{x^2}$$

c) a^4b^2 , a^3b^5 , & a^2b^3

$$\boxed{a^2b^2}$$

OBJECTIVE 3: Factoring Out the Greatest Common Factor

First step is to factor out the **GCF**.

Helpful Hint

A factored form of $8x + 14$ is *not*

$$2 \cdot 4x + 2 \cdot 7$$

Although the *terms* have been factored (written as products), the *polynomial* $8x + 14$ has not been factored (written as a product).

A factored form of $8x + 14$ is the *product* $2(4x + 7)$

✓ **CONCEPT CHECK**

Which of the following is/are factored form(s) of $7t + 21$?

a. 7 b. $7 \cdot t + 7 \cdot 3$ c. $7(t + 3)$ d. $7(t + 21)$

$$\begin{array}{c} \underline{7}t + \underline{3} \cdot \underline{7} \\ \hline 7(t + 3) \end{array}$$

Example 4: Factor each polynomial by factoring out the GCF.

a) $6t + 18$
 $\frac{6t}{6} + \frac{18}{6}$
 $2 \cdot 3 \cdot t + 3^2 \cdot 2$
 $2 \cdot 3 = 6$
 $6(t + 3)$

b) $y^5 - y^7$

$y^5(1 - y^2)$

$y^5 = 1$
 y^7
 y^{7-5}

Practice 4:

a) $4t + 12$

$2^2 t + 2^2 \cdot 3$

$2^2(t + 3)$

$4(t + 3)$

b) $y^8 + y^4$

$y^4(y^4 + 1)$

y^8
 y^4
 y^{8-4}
 $y^4 = 1$

Example 5: Factor: $-9a^5 + 18a^2 - 3a$

$-1 \cdot 3^2 a a a a a$ $3^2 \cdot 2 a a$ $-1 \cdot 3 a$

$3a$

$3a(-3a^4 + 6a - 1)$

Practice 5: $-8b^6 + 16b^4 - 8b^2$

$-1 \cdot 2^3$
 $b b b b b b$

2^4
 $b b b b$

$-1 \cdot 2^3$
 $b b$

$2^3 b^2$

$8b^2(-b^4 + 2b^2 - 1)$

Examples 6 - 8: Factor.

6) $6a^4 - 12a$

$$6a(a^3 - 2)$$

7) $\frac{3}{7}x^4 + \frac{1}{7}x^3 - \frac{5}{7}x^2$

$$\frac{1}{7}x^2(3x^2 + x - 5)$$

8) $15p^2q^4 + 20p^3q^5 + 5p^3q^3$

$$5p^2q^3(3q + 4pq^2 + p)$$

Practices 6 - 8: Factor.

6) $5x^4 - 20x$

$$5x(x^3 - 4)$$

7) $\frac{5}{9}z^5 + \frac{1}{9}z^4 - \frac{2}{9}z^3$

$$\frac{1}{9}z^3(5z^2 + z - 2)$$

8) $8a^2b^4 - 20a^3b^3 + 12ab^3$

$$4ab^3(2ab - 5a^2 + 3)$$
